

Iran and B-Movie Israeli Propaganda

by Tzvi Ben Gedalyahu via ron - Israel National News *Wednesday, Dec 5 2012, 10:01pm*
international / prose / post

The article below from the Israeli media is pure B-Movie hype designed to intimidate whom? We do not know! While Electro-Magnetic Pulse Bombs were first publicised to impress Americans prior to the illegal Iraq invasion they were never used due to their unpredictability; these weapons are still largely experimental and extremely imprecise and like the Drone -- which can be targeted like a duck in a pond by any modern air force -- EMP 'bombs' are easily counter-measured as they are too unstable to be an effective weapon in any real conflict, notwithstanding the threat of such a device would necessitate an over-reaction from the target nation.

Indeed, the threat of this type of warfare forces full scale radical responses to counter any such threat, real or imaginary. What becomes immediately apparent and cause for concern however, is the infantile approach this Israeli B-Movie sensationalist article projects -- learn that good and effective propaganda is understated, never over the top like American propaganda that only dumbass Americans believe; Persians are a far more sophisticated and experienced culture!

However, remember that any threat or possible conflict involving radical weapons warrants long term preparatory and retaliatory strategies -- the Persians are not to be underestimated, they have learned over thousands of years of empire conquest and defeat!

The hard reality of the matter is that ANY war of aggression against non-invasive Iran would be DISASTROUS for the entire region if not the ENTIRE WORLD. It is clear today that the most unstable, aggressive and dangerous nation in the region is Israel.

Story from the Israeli media follows:

Video: Doomsday for Iran? US Tests EMP Bomb

Israel National News -- Boeing has successfully tested an electro-magnetic pulse (EMP) missile that turns "science fiction into science fact" and could be the doomsday weapon against Iran, but media have largely ignored the development.

The U.S. Air Force and Boeing demonstrated the device more than two months ago over a military site in the Utah desert, reported the VR-Zone technology website.

Boeing did not keep the test a secret, but most mainstream media and technology sites overlooked the report.

The test was codenamed CHAMP -- Counter-Electronics High Power Advanced Missile Project and was the first time a real EMP missile has been tested with positive real world results.

One of the most startling developments in the research and test is that the missile

system does not use any explosives, thereby limiting damage to its intended goal of directing microwave energy that can cause instant blackouts.

Keith Coleman, who serves as Boeing's CHAMP program manager in their Phantom Works division, stated that video camera showed "images of numerous desktop computers running, and then suddenly all of them go out quickly followed by the camera going to black," VR-Zone reported.

"We hit every target we wanted to... Today we made science fiction, science fact," said Coleman.

An Arutz Sheva opinion article in August mentioned Israel's possible use of an EMP bomb against Iran. The report triggered a chain reaction, allegedly influencing U.S. intelligence sources who have since been quoted in several publications with doubtful assumptions that the article reflected Israel government thinking.

The London Times subsequently reported that an EMP bomb could cripple Iran by shutting down its electronics and sending the Islamic Republic "back to the Stone Age."

EMP causes non-lethal gamma energy to react with the magnetic field and produces a powerful electromagnetic shock wave that can destroy electronic devices, especially those used in Iran's nuclear plants.

The shock wave would knock out Iran's power grid and communications systems for transport and financial services, leading to economic collapse.
